

# Research and practice of historic mortars and concrete

## Some background information

15 years as researcher at the Concrete and Silicate laboratory in the Research Centre of Finland (VTT)

Project with historical mortars, 1982 – 1985

Ancient and modern Mortars in the Restoration for Historical Buildings. Espoo 1985, VTT, Research Notes 450.

Deterioration in bricks due to salts - mechanisms of salt deterioration Espoo 1989, VTT Research Notes 1003

Heikkinen Aino &  
von Konow Thorborg.

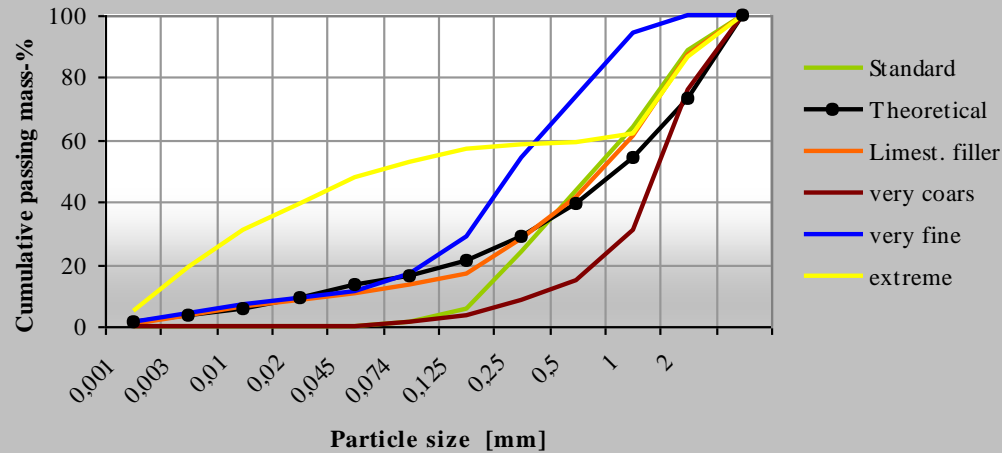

The cement mortar got more and more popularity also in the restoration, from 1920 to 2000 – why?

Modern lime mortars had shown to have a very weak durability, in praxis and in lab.tests.

Cement- and lime-cement mortars have a rough curing. They have additives – for the masons easy to work with.

How could the lime mortars used for restoration be improved?

The aggregate grain size distribution works for lime mortars as for microproportioned concrete, but with a different starting point.

To improve the durability - frost resistance

Not to increase the compressive strength
